

Medium Voltage Distribution

Rollarc R400 - R400D

Contactor 1 to 12 kV

Catalogue

2008

A new path for achieving your electrical installations

A comprehensive offer

The Rollarc range is part of a comprehensive offer of products that are perfectly coordinated to meet all medium and low voltage electrical distribution requirements. All of these products have been designed to work together: electrical, mechanical and communication compatibility.

The electrical installation is thus both optimised and has improved performance:

- better service continuity,
- increased personnel and equipment safety,
- guaranteed upgradeability,
- efficient monitoring and control.

You therefore have all the advantages at hand in terms of know-how and creativity for achieving optimised, safe, upgradeable and compliant installations.

Tools for facilitating the design and installation

With Schneider Electric, you have a complete range of tools to help you get to know and install the products whilst complying with current standards and good working practices. These tools, technical sheets and guides, design software, training courses, etc are regularly updated.

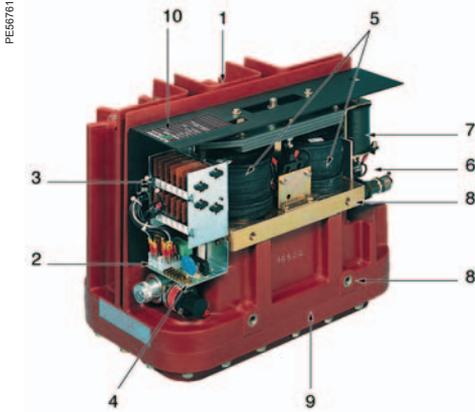

**Schneider Electric is associating itself
with your know-how and your creativity
to produce optimised, safe, upgradeable
and compliant installations**

For a real partnership with you

A universal solution doesn't exist because each electrical installation is specific. The variety of combinations on offer allows you to truly customise the technical solutions.

You are able to express your creativity and put your know-how to best advantage when designing, manufacturing and exploiting an electrical installation.

Description

The Rollarc three-pole indoor contactor uses sulphur hexafluoride (**SF6**) gas for insulation and circuit-breaking.

Circuit-breaking is based on the rotating arc principle. The basic version is made up of three pole units installed in the same insulating enclosure. The part of the enclosure containing the active parts of the poles is filled with SF6 gas at a gauge pressure of 2.5 bars.

There are two types of Rollarc contactors:

- The R400, with magnetic holding
- The R400D, with mechanical latching.

Main advantages

- A modern and tested circuit-breaking technique featuring SF6 safety
- No maintenance for active parts
- High mechanical and electrical endurance
- Low switching surges without additional devices (surge arrester)
- Insensitivity to the environment
- Gas pressure may be continuously monitored.

Field of application

Protection and control of:

- MV motors
- Capacitor banks and power transformers.

Utilisation range

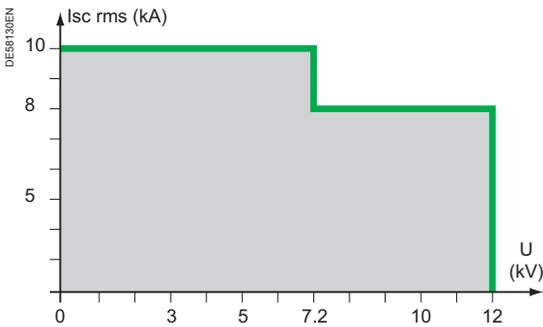

Standards

Rollarc complies with the following standards and specifications:

- IEC publication 60470
- IEC 62271-105.

Installation references

- Solmer, Michelin, Shell, Esso, CFR, Pechiney, Naphtachimie, Usinor, Sacilor, Sollac
- Nuclear and conventional thermal power stations
- Mines de Saar (Germany)
- Nokia (Finland), Kafak (Sweden).

The Rollarc R400 and R400D contactors are available in three versions:

Basic version

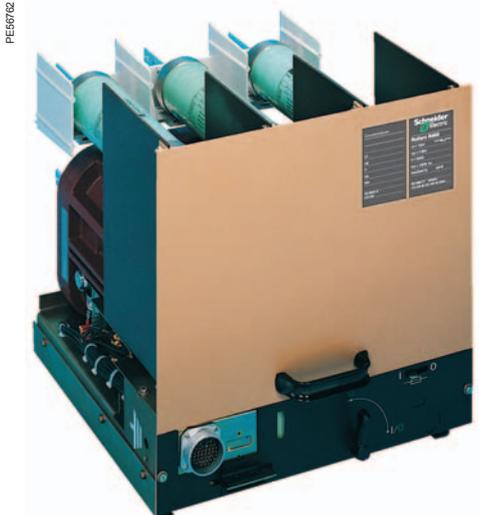

Contactors alone, without the cradle.

PE60247

Fixed version

The contactor with the control auxiliaries is mounted on a fixed cradle.

PE60762

Withdrawable version

The contactor with the control auxiliaries is mounted on a withdrawable cradle.

PE60763

Fixed and withdrawable versions may be equipped with fuses when the short-circuit current is greater than the contactor rating.

The fuses used are of the indoor Fusarc CF type with strikers that actuate the contactor opening mechanism.

PE30250

Enclosure

The epoxy resin enclosure ensures:

- high mechanical strength enabling use as a support for the active parts and resistance to electromechanical stress.
- excellent dielectric strength due to the nature of the material and the design.
- a very reliable seal (sealed pressure system in compliance with standard IEC 60694).

The filling pressure remains constant throughout the life of the contactor.

PE30251

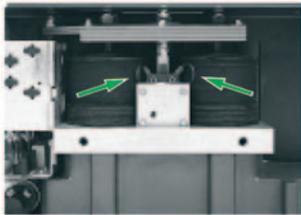

Active parts and operating mechanism

The essential parts include the:

- arc interruption device,
- insulating rod which actuates the mobile contacts and the corresponding fixed terminal.

These parts are housed in an enclosure which is sealed for life and are thus totally insensitive to the environment. The resulting elimination of corrosion increases the reliability of the device.

PE30253

Electromagnetic coils

Rollarc is actuated by electromagnetic coils that ensure closing and hold the device in the closed position.

 coil

PE30253

Auxiliary contacts

The auxiliary switch subassemblies are always mounted on the enclosure.

PE30254

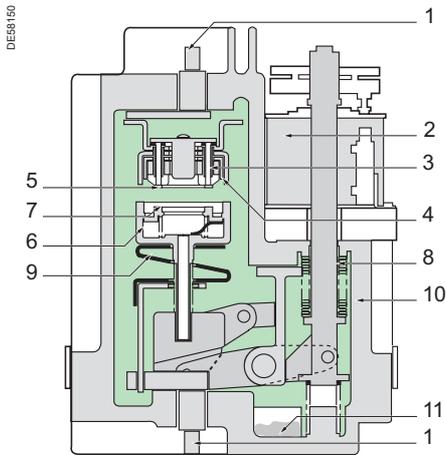

Mechanical latching

The R400D is actuated by electromagnetic coils that ensure closing of the device and has a mechanical latching device which holds the contactor in the closed position without a continuous power supply.

A release is used to free the latching mechanism.

 Mechanical latching device

- 1 - MV terminals
- 2 - Electromagnet
- 3 - Blowout coil
- 4 - Fixed main contact
- 5 - Fixed arcing contact
- 6 - Moving main contact
- 7 - Moving arcing contact
- 8 - Sealing bellows
- 9 - Flexible connector
- 10 - Enclosure
- 11 - Molecular sieve

Rollarc pole unit

Each pole unit consists of:

- a **main circuit** composed of a fixed main contact (4) and a moving main contact (6)
- a **breaking circuit** composed of a fixed arcing contact (5) and a moving arcing contact (7) that form two circular runners.

A blowout coil (3) is mounted in series in the circuit.

The main circuit that ensures the flow of the current is distinct from the breaking circuit in which the arc is produced.

- a transmission mechanism for the transfer of energy from the operating mechanism to the mobile contacts.

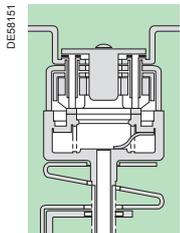

Fig. 1

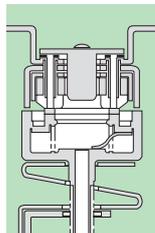

Fig. 2

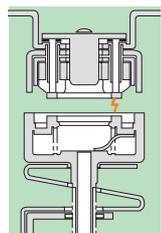

Fig. 3

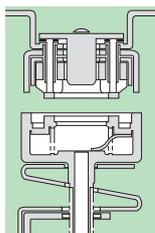

Fig. 4

Operation

Rollarc 400 is a magnetic device that uses the rotating arc technique to interrupt the current.

- at the beginning of an opening cycle, the main contacts and the arcing contacts are closed (fig. 1).
 - isolation of the main circuit is achieved by the separation of the main contacts (fig. 2). The arcing contacts are still closed. The current flows through the coil, the arcing contacts and the flexible connector.
 - the arcing contacts open shortly after the main contacts. The resulting arc is made to rotate between the two circular runners of the arcing contacts by the electromagnetic field produced by the coil, the force of which depends on the current to be interrupted (fig. 3).
- By design and due to phase shift between the current and the electromagnetic field, this force is still significant at zero current.
- at zero current, the gap between the contacts recovers its initial dielectric strength thanks to the inherent qualities of SF6 gas (fig. 4).

Electrical characteristics

Auxiliary switches	
Rated current	10 A
Breaking capacity	DC: (L/R = 0.015 s) 0.5 A / 220 V
	AC: (p.f. = 0.3) 10 A / 220 V

Electrical endurance

This curve indicates the number of operations N according to the breaking current I, in class AC3 or AC4.

- **R400**
 - 300 000 operating cycles at 250 A
 - 50 operating cycles at 10 000 A.
- **R400D**
 - 100 000 operating cycles at 200 A
 - 50 operating cycles at 10 000 A.

When the contactor is used in conjunction with fuses, the maximum switching capacities may be determined using the fuse curves and by taking into account:

- the characteristics of the load (motor starting currents, starting times, transformer inrush currents)
- the amplitude of the limited interrupted current which is a function of the prospective fault current and the fuses employed. The limited interrupted current should not exceed the electrodynamic withstand capacity of the contactor.

For values less than those presented in the table below, see:

- for motor control, page 22
- for transformers, technical sheet AC0479E.

(1) With p.f. = 0.92 η = 0.94

(2) For higher fuse ratings, consult us

Note: fuse ratings depend on the maximum power.

For lower powers, the correct fuse rating must be determined (see page 21).

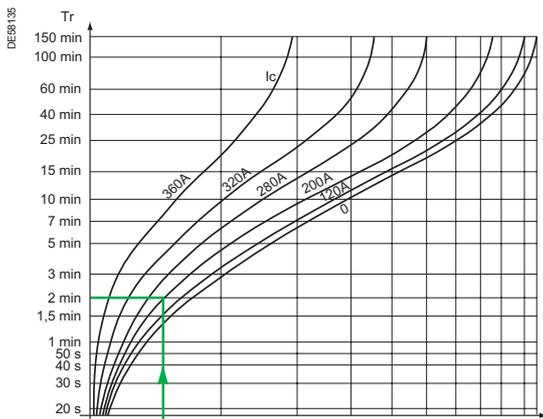

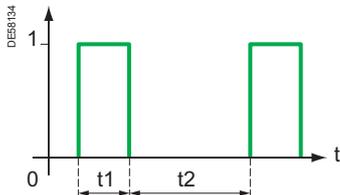

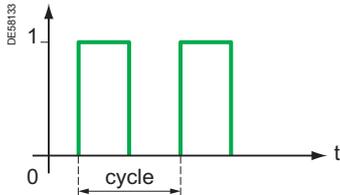

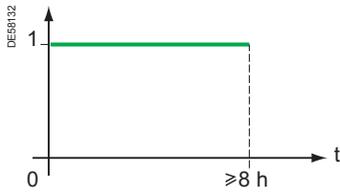

Fig. 2

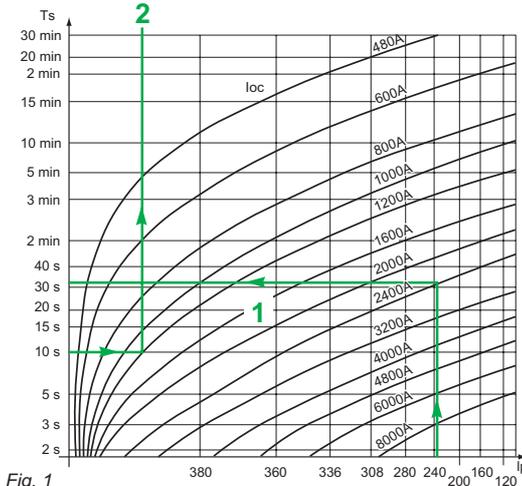

Fig. 1

IEC standard 60470 (chapter 2) defines three types of contactor operation:

■ **Continuous operation**

In position 1, the contactor equilibrium temperature is reached.

■ **Periodical intermittent operation** (or intermittent)

In position 1, the contactor equilibrium temperature is not reached.

■ **Short-time operation**

In position 1, the contactor equilibrium temperature is not reached.

t1: standardized values 10 min - 30 min - 60 min - 90 min

t2: time required for the contactor to cool to the temperature of the cooling medium.

Intermittent and short-time operation

■ **Allowable overcurrents**

The two sets of curves presented here can be used to determine allowable overcurrents in the Rollarc contactor.

■ **The maximum value of an overcurrent and the cooling time**

Using the permanent current value I_p , figure 1 can be used to determine the maximum duration of T_{oc} along line 1.

The time required for cooling T_c to ensure that the equilibrium temperature is not exceeded may be determined using figure 2.

Example: a Rollarc contactor with a permanent operating current $I_p = 240$ A can withstand a temporary overload of 2400 A for 32 seconds.

The cooling time T_c is:

- 25 minutes if the circuit is open
- 28 minutes if a 120 A current flows through the contactor
- 48 minutes if a 200 A current again flows through the contactor.

■ **Cyclical overcurrent**

the fourth parameter (see line 2 between figures 1 and 2) can be determined when three of the four below are known:

- I_{loc} overcurrent
- T_{oc} duration of overcurrent
- I_c cooling current
- T_c duration of cooling.

Example:

I_{loc} 1200 A for 10 seconds

T_c 200 A for 2 minutes.

Rollarc operating mechanism

The contactor is closed by an electromagnet (pick-up coil YF).

- for the magnetically held contactor R400, two seal-in coils (YM) are inserted in the circuit at the end of closing. The contactor is tripped by the opening of the holding circuit.

- for the mechanically latched contactor R400D, the contactor is held in closed position by the mechanical latching system. The contactor is tripped by a shunt trip which releases the latching device.

Auxiliary switches

Rollarc contactors are equipped with ten changeover common point auxiliary switches. Consult the equipment selection table for information on the number of available switches.

Pressure switch

The optional pressure switch for alarm indications closes a changeover switch if the gas pressure drop below 1.5 bars.

Contact breaking capacity:

- AC (p.f. = 0.6) 2.2 A at 127 V
- DC 0.5 A at 120 V - 0.4 A at 220 V.

The Rollarc rotating arc contactor is a modern device with enhanced cooling of the arc by forced convection leading to the following advantages:

Long life

This results from:

- high product reliability
- very low wear of the active parts which require no maintenance
- the excellent sealing of the enclosure, eliminating the need for subsequent filling.

Mechanical endurance

The operating energy is reduced because arc rotation is directly created by the current to be interrupted.

The Rollarc contactor can do 300 000 operations in R400 version and 100 000 operations in R400D version.

Electrical endurance

The long life of the Rollarc is due to the negligible degeneration of the gas and to low wear of the contacts.

The energy dissipated in the arc is low due to:

- the intrinsic properties of the gas
- the short length of the arc
- the very short arcing time.

Wear of the arcing contacts can be checked without opening the poles. The unit is capable of breaking all load and short-circuit currents, even in the case of frequent operation. With very high breaking capacity for a contactor, the Rollarc can be used in a fuse-contactor assembly capable of protecting any circuit against all types of faults including overloads.

Low switching surges

The intrinsic properties of the gas and the soft break resulting from this technique means that switching surges are very low.

Concerning motor start-up, the unit is free from multiple prestrike and restrike phenomena which could damage the winding insulation.

Operating safety

The Rollarc contactor operates at a low relative pressure of 2.5 bars.

Continuous monitoring of the contactor pressure (optional)

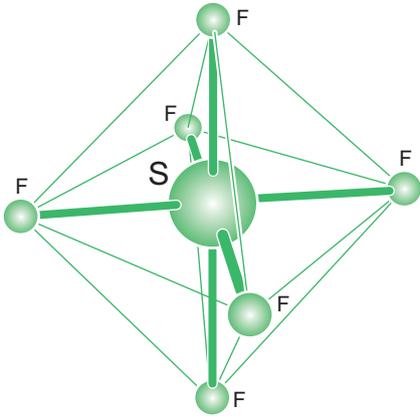

A pressure switch actuates a contact in the event of an accidental drop in the pressure of the SF6 gas in the Rollarc unit.

Insensitivity to external conditions

The Rollarc pole unit provides a totally gas-insulated system. It is a hermetically sealed enclosure filled with SF6 gas and housing the essential parts.

Rollarc is particularly suited to polluted environments such as mines, cement works, etc.

DE68146

Sulphur hexafluoride (SF6) gas properties

SF6 is **non-inflammable**, very stable, **non-toxic gas**, five times heavier than air. Its dielectric strength is much higher than that of air at atmospheric pressure.

Gas for interruption

SF6 is "the" arc-interruption gas, combining the best properties:

■ **high capacity for carrying away the heat produced by the arc.**

The latter is rapidly cooled by convection during the arcing period.

■ **high radial thermal conduction and high electron capturing capacity**

When the current passes through zero, the arc is extinguished by the combination of two phenomena:

□ SF6 permits rapid heat exchange from the center of the arc toward the exterior.

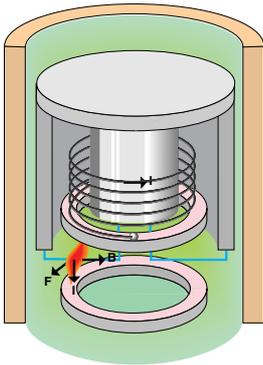

□ fluorine atoms, which are highly electronegative, act as veritable "traps" for electrons.

Since it is electrons which are mainly responsible for electric conduction in the gas, the gap between the contacts recovers its initial dielectric strength through this electron capture phenomenon at zero current.

■ **the decomposition of the SF6 molecule is reversible**

The same mass of gas is therefore always available, making the device self-sustained throughout its operating life.

DE60355

The rotating arc principle

The exceptional characteristics of SF6 gas are used to extinguish the electrical arc. Cooling is enhanced by the relative movement between the arc and the gas.

In the rotating arc technique, the arc is set in motion between two circular arcing contacts (see figure opposite).

When the **arcing contacts** separate, the current to be interrupted flows through a solenoid, thus creating an electromagnetic field B.

When the **arcing contacts** separate, the arc appears between them. The arc is made to rotate between the two circular arcing contacts by force F, the combined result of the electromagnetic field and the current.

Force F is directly proportional to the square of the current to be interrupted.

This breaking technique therefore automatically adapts to the current to be interrupted:

When the current is high, the speed of rotation is high (speed of sound) and cooling is intense. Just before reaching zero current, the speed is still sufficient to make the arc rotate and thus contribute to the recovery of dielectric strength at zero current.

Wear of the arcing contacts is very low.

When the current is low, the speed of rotation is also low.

This leads to very soft breaking of the arc without surges, comparable to the widely appreciated performances of the air breaking technique.

Breaking of inductive or capacitive currents

The Rollarc contactor does not generate voltage surges.

On some switchgear such surges occur during the breaking of low inductive or capacitive currents and can damage the insulation of connected devices.

With the rotating arc technique, the rotation speed of the arc is low for low currents and breaking is soft under all conditions:

- current chopping: (arc interruption before zero current) the chopping current is always less than 1 A, i.e. the voltage surge is very low for the load.
- multiple prestrikes and restrikes

Other phenomena exist that are much more dangerous to the load than the voltage surges resulting from current chopping. Such phenomena occur if the device tries to break high frequency currents.

High frequency currents appear when there is a dielectric breakdown (opening of contacts is too close to zero current) and produce high frequency waves that are very dangerous for motor insulation.

Given the relatively slow dielectric regeneration between its arcing contacts, the Rollarc contactor avoids breaking high frequency currents and multiple prestrike and restrike phenomena are prevented.

The Rollarc is thus the perfect motor control contactor.

It provides the user and the network with total security without requiring additional accessories such as surge arresters or RC systems.

Results of tests on Rollarc

Motor starting current	Busbar capacitance (Cb)	Busbar capacitance and compensation (Cb+Cc)	Overvoltage Pu ⁽¹⁾			Multiple restrikes
			Average	Standard deviation	Max.	
100 A	0.05 mF		1.76	0.18	2.35	none
100 A		1.8 mF	1.88	0.13	2.23	none
300 A	0.05 mF		1.69	0.10	1.90	none
300 A		1.8 mF	1.79	0.09	1.91	none

$$(1) PU = \frac{\text{measured peak voltage}}{\frac{U\sqrt{2}}{\sqrt{3}}}$$

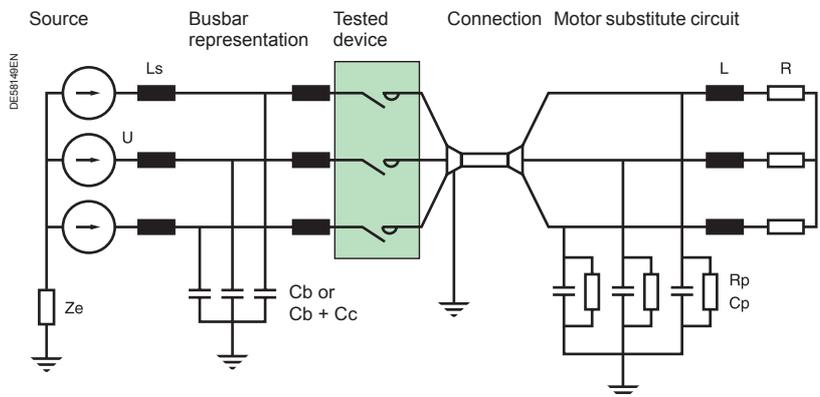

Example: peak voltage $7.2 \times 1.76 \frac{U\sqrt{2}}{\sqrt{3}} = 10.35 \text{ kV}$

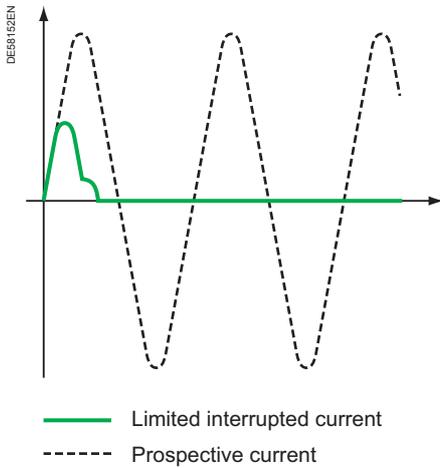

Test circuit diagram

100 A 7.2 kV and 300 A 7.2 kV

Tests according to IEC draft standard (17 A secretariat 291). Overvoltage levels depend on the breaking device, and also on the circuit. The IEC standard proposes a standard motor breaking circuit.

- Ze: earth impedance
- Ls: power supply inductance
- Cp: load parallel capacitance
- U: power supply voltage
- Cc: compensation capacitance
- Rp: load parallel resistance
- Cb: capacitance of the bars
- Lb: inductance of the bars
- L: load inductance
- R: load resistance

Fuse-contactor combinations

Principle

The contactor switches the load on and off during normal operation or an overload. The fuse ensures correct interruption of short-circuit currents according to the network short-circuit level. A "fuse-blown" device causes contactor opening.

Economic advantages

For a short-circuit level of 500 MVA, or of 50 kA at 6 kV, the saving in switchgear costs is more than 50% compared to a circuit breaker solution.

Technical advantages

Contactor: high switching rates and greater mechanical endurance than a circuit breaker.
Fuse: current limitation that considerably reduces the thermal and electrodynamic effects of a fault (fig. 1).

Transformer control and protection

Select the fuse using the table below.

Selection table (ratings in A)⁽¹⁾

Service voltage (kV)	Type of fuse	Transformer rating (kVA)															
		25	50	100	125	160	200	250	315	400	500	630	800	1000	1250	1600	
3	Fusarc CF	16	25	50	50	63	80	80	125	125	125	160	200	250			
3.3		16	25	40	50	50	80	80	100	100	125	160	200	250			
5.5		10	16	31.5	31.5	40	50	50	63	80	100	125	125	160	200		
6		10	16	25	31.5	40	50	50	63	80	80	125	125	125	160	200	
6.6		10	16	25	31.5	40	50	50	63	80	80	100	125	125	160	200	
10		6.3	10	16	20	25	31.5	40	50	50	63	80	80	100	100		

(1) Installation without transformer overload

η = motor efficiency

U_a = rated motor voltage

I_d = start up current

T_d = start up time

Motor protection

The Fusarc CF fuse in association with a Rollarc contactor constitutes a particularly effective protection device for MV motors.

Fuse rating

The three charts given below enable the fuse rating to be determined when we know the motor power (P in kW) and its rated voltage (U_a in kV).

Chart 1: this gives the rated current I_n (A) according to P and U_a .

Chart 2: this gives the start-up current I_d (A) according to I_n (A).

Chart 3: this gives the appropriate rating according I_d and the start-up duration time t_d (s).

Comments

Chart 1 is plotted for a power factor of 0.92 and an efficiency of 0.94.

For values different to this, use the following equation: $I_n = \frac{P}{n \sqrt{3} U_a \cdot \text{p.f.}}$

■ chart 3 is given in the case of 6 start-ups spread over an hour or 2 successive startups .

■ For n successive start-ups ($n > 6$), multiply t_d by $\frac{n}{6}$

For p successive start-ups ($p > 2$), multiply t_d by $\frac{p}{2}$

In the absence of any information, take $t_d = 10$ s.

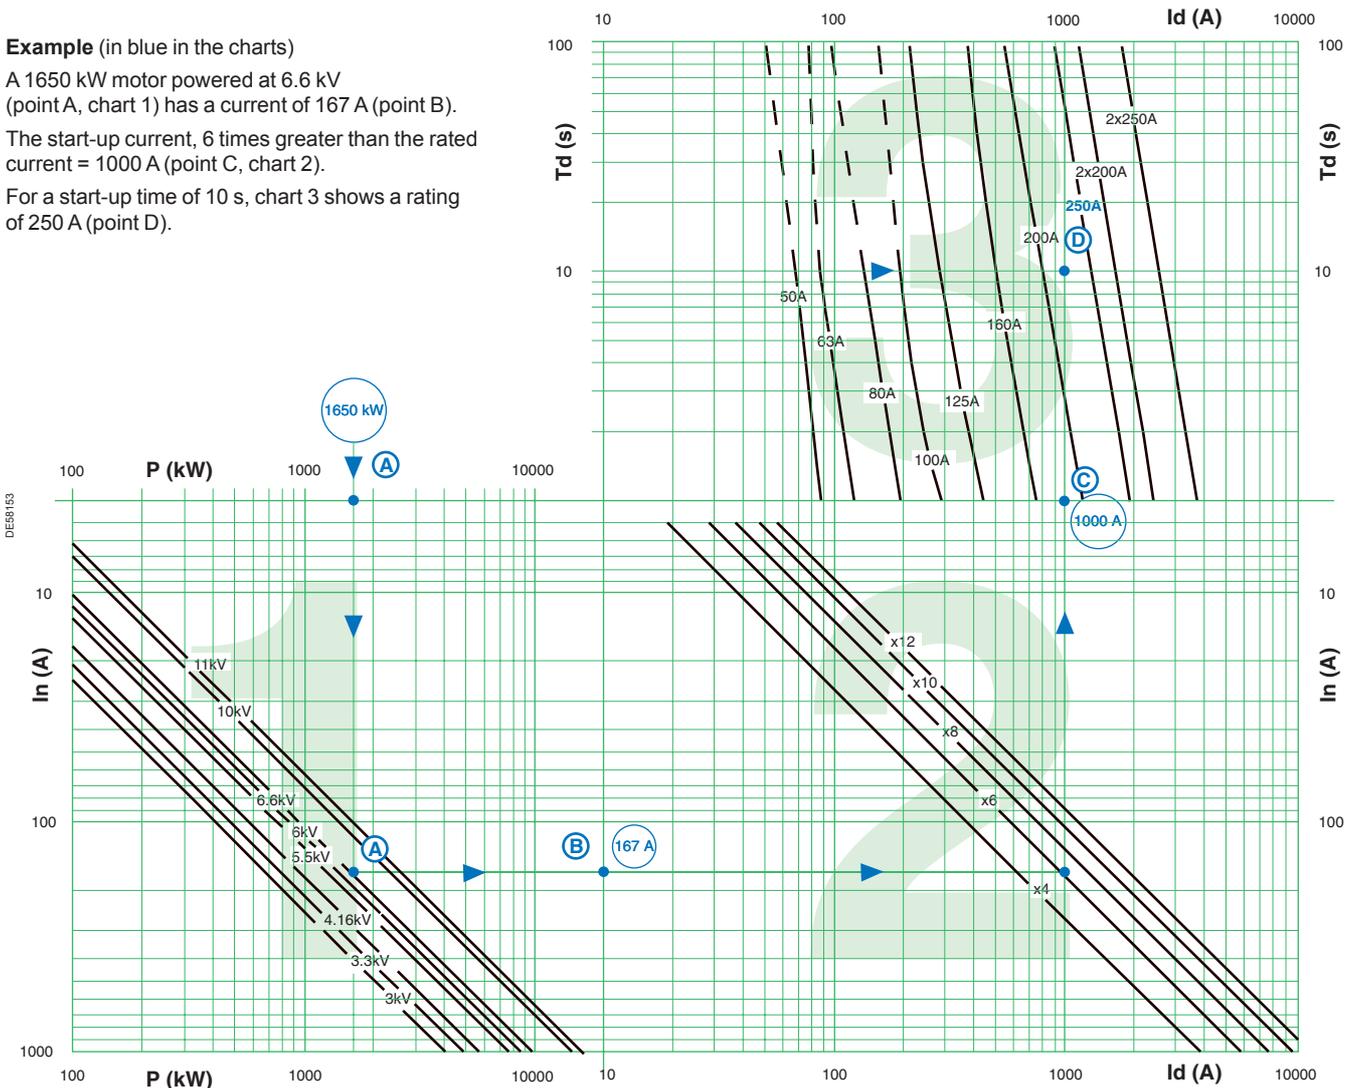

■ if the motor start-up is not direct, the rating obtained using the charts below may be less than the full load current of the motor. In this case, we have to choose a rating 20% over the value of this current, to take account of the cubicle installation.

Example (in blue in the charts)

A 1650 kW motor powered at 6.6 kV (point A, chart 1) has a current of 167 A (point B).

The start-up current, 6 times greater than the rated current = 1000 A (point C, chart 2).

For a start-up time of 10 s, chart 3 shows a rating of 250 A (point D).

Only one of the boxes (ticked or filled by the needed value) have to be considered between each horizontal line.

Green box corresponds to none priced functions.
